

CL_M — Role-Stratified Scheduling Audit: The CH Priority Paradox
Despite receiving priority, CHs in role-based protocols wait longer and members are starved of dock access

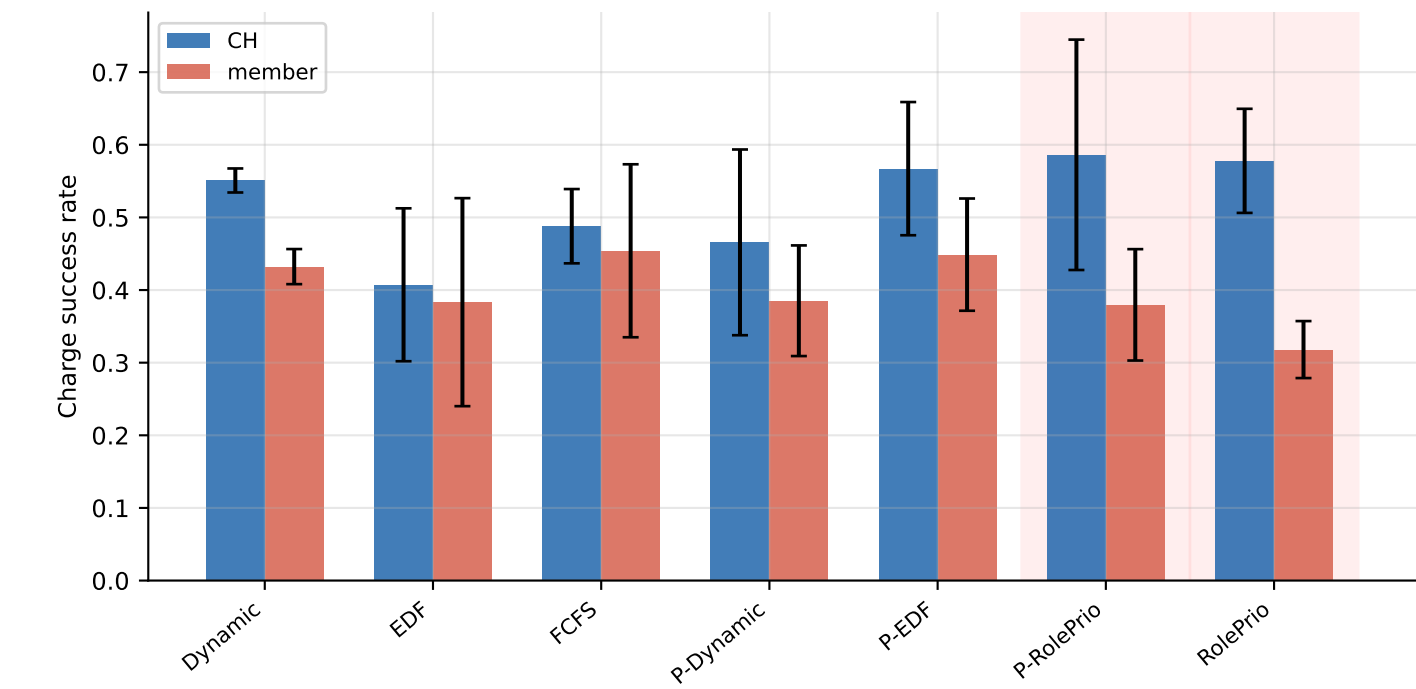

A — Decision Latency
(CH blocks CH → paradox)

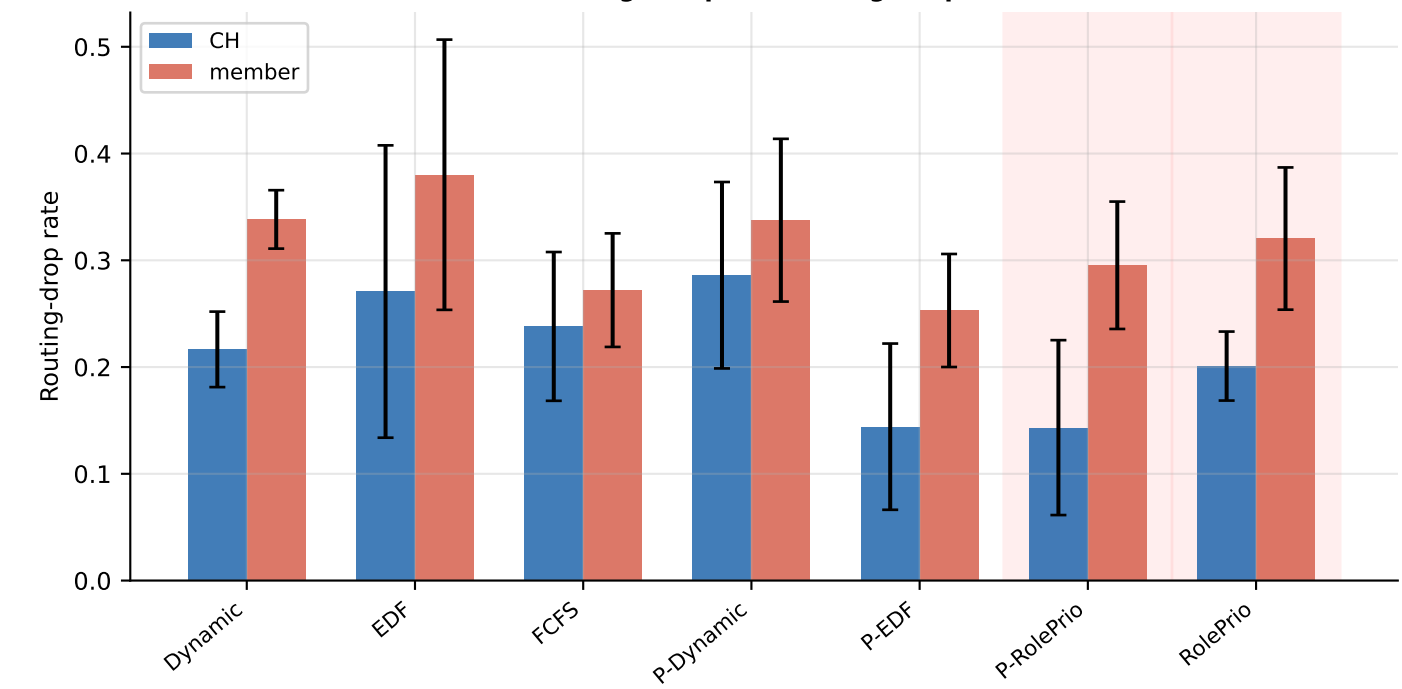

B — Effective Wait at Dock

C — Charge Success Rate
(member starvation in role-based)

D — Charge Request Routing-Drop Rate

Red shading = role-based protocols (ugv_role_priority, ugv_p_role_priority). Blue bar = CH (role=1); red bar = member (role=0).
Error bars = 1 SD across 3 replicates.
